# Use of NHPs is ethically and scientifically problematic

Strong public opinion on ethics of using NHP

Predictive value?

TGN1412, Herceptin

NHP use in drug development is increasing

“We saw human guinea pigs explode” – *Sun*  
“His head had swollen three times its normal size. None of us recognized him” – *Daily Star*  
“It felt like a truck had been parked on my head. Then, somehow, the pain got worse” -*Sun*

## CHIMPANZEE RESEARCH ON TRIAL

As pressure from activists builds, the United States is considering whether it should end invasive experiments in chimpanzees.

Wadman, *Nature*, Vol 474, Jun 2011

# Study the relevance and value of the NHP model in regulatory animal studies

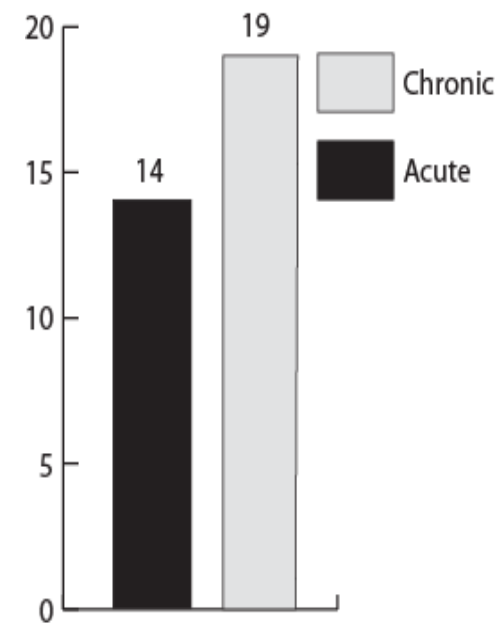

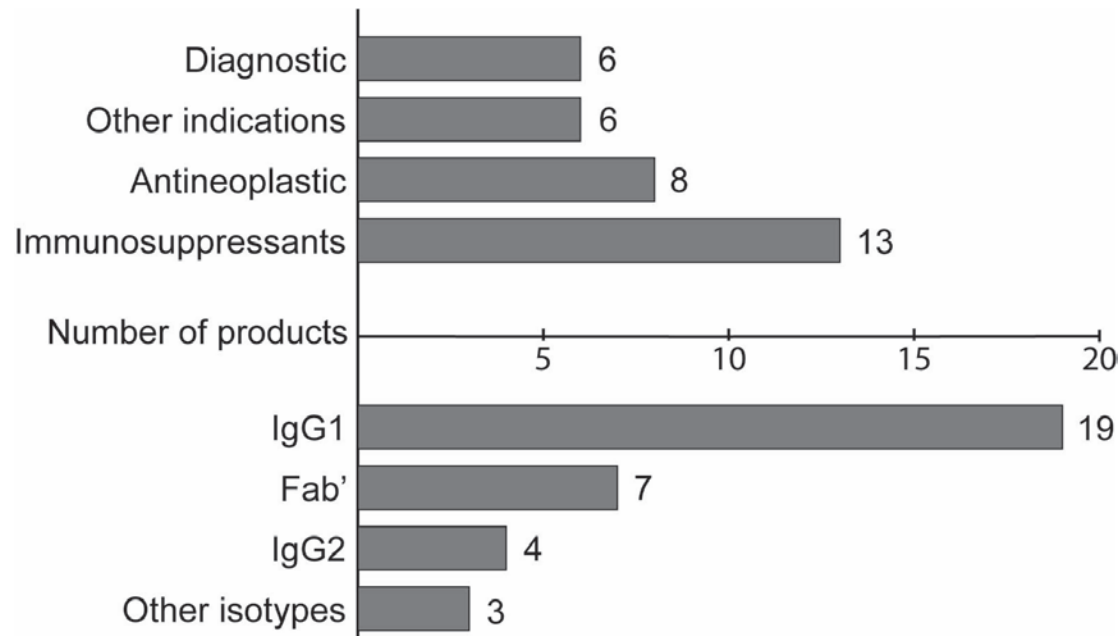

Almost 30 years of experience developing MABs

What was the value of NHP in MAb development?

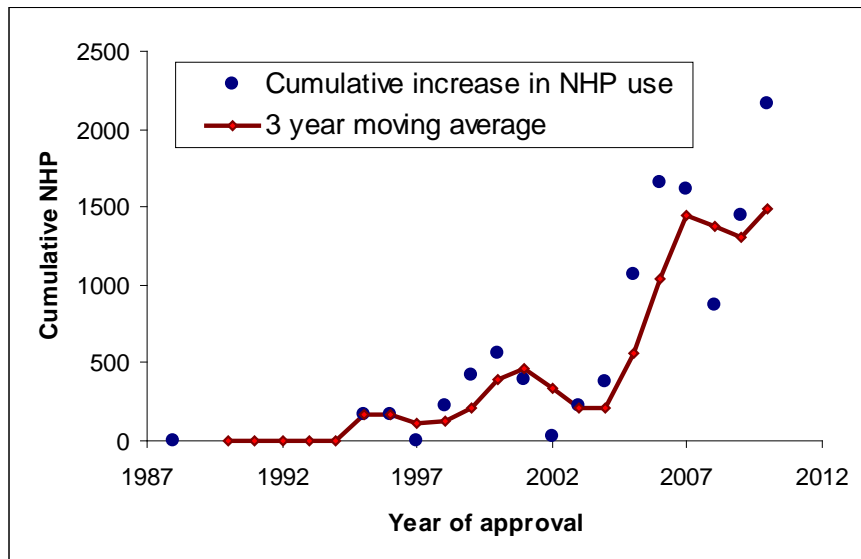

# 33 monoclonal antibodies have been registered in the EU by the EMA

Centralized approval between 1988-2010

# The number of nonhuman primates used for the development of monoclonal antibodies is increasing

| Species       | NHP (n)   |
|---------------|-----------|
| Cynomolgus    | 5188 (24) |
| Marmoset      | 388 (2)   |
| Rhesus        | 379 (6)   |
| Chimpanzee    | 68 (3)    |
| Baboon        | 18 (1)    |
| African Green | 9 (1)     |

|                         | Chronic   | Acute   |
|-------------------------|-----------|---------|
| Average NHP/product     | 285 ± 223 | 45 ± 62 |
| Min/Max NHP/product     | 0/755     | 1/164   |
| Average studies/product | 12 ± 6    | 6 ± 7   |
| Min/Max studies/product | 4/31      | 1/22    |

# Known effects

# Only pharmacological effects

## Safety profile of MABs in NHP

60% of MABs were well tolerated or had minimal pharmacological adverse effects

40% (exaggerated) pharmacology or immune reactions, including DART

The human side effect profile also limited to pharmacology and/or immunogenicity.

## Use of necropsy

Supporting clinical observations, lab tests

Did not result in new findings

# Study Design and Model

## Examples that limit the value of NHP use

### Studies using chimpanzees

Poor study design, sub-optimal dosing and study conduct  
Safety assessment not optimal for the patient population:  
Repeat in mice + surrogate MAb

### Inconclusive results

Sample size (hazard identification)  
Lack of experience with cyclosporine-a  
Wild caught / old monkeys  
'NHP may not represent human situation'

# Immunogenicity

# Immunogenicity of monoclonal antibodies in NHP limit their value

MAbs were immunogenic in NHP in almost every study (98%)

Highly immunogenic in 30% (8 cases)

Increased clearance in 78% (21 cases)

Limited duration of chronic toxicity studies in 19% (5 cases)

Interpretation (PK and/or PD) limited in 44% (12 cases)

## The value of NHP research in MAb development

30 years of MAb development with NHP; a **knowledge base**

The scientific value of future NHP studies is **limited**:

**Expected** pharmacology or secondary effects.

**ADA's** limit the interpretation and relevance of NHP

**Study design** further reduces the relevance of NHPs.

## Looking ahead

**Limit** the use of NHP in drug development

Industry

**Minimal**/confirmatory studies

**In vitro/surrogate** endpoints

Make data **public**

Regulatory authorities

Increase **scientific advice**

**Discourage** check-box

**Reduce** regulatory demands

Governments

**Incentivize**
